The 2007 Commitment to Development Index: Components and Results

By David Roodman*

The Commitment to Development Index (CDI) ranks 21 of the world’s richest countries on their dedication to policies that benefit the five billion people living in poorer nations. Moving beyond standard comparisons of foreign aid volumes, the CDI rates countries on:

- Quantity and quality of foreign aid
- Openness to developing-country exports
- Policies that influence investment
- Migration policies
- Environmental policies
- Security policies
- Support for creation and dissemination of new technologies

Scores on each component are scaled so that an average score in the CDI’s first year, 2003, is equal to 5.0. A country’s final score is the average of those for each component.
Throughout, the CDI adjusts for size in order to compare how well countries are living up to their potential to help. For example, the United States gives much more foreign aid than Denmark, but far less for the size of its economy, so Denmark scores higher on this measure. Similarly, U.S. tariffs on clothing and crops from developing countries do much more harm than Denmark’s because of the sheer size of the U.S. market. But since U.S. tax rates on imports are actually lower, the United States scores higher on trade. The CDI quantifies the full range of rich country policies that have an impact on poor people in developing countries. The Index builds on contributions from scholars at the Center for Global Development, the Brookings Institution, Georgetown University, the Migration Policy Institute, the World Resources Institute, and the University of Colorado. For more information about the CDI, go to www.cgdev.org/cdi.

Why does the CDI matter? In an increasingly integrated world, rich countries cannot insulate themselves from global poverty and insecurity. Poverty and weak institutions can breed global public health crises, security threats, and economic instability that can destabilize an entire region, sending shockwaves around the world. Another reason is fairness. Current trade policy, for example, places disproportionate burdens on poor countries. Finally, the Index looks at whether countries are consistent in their values. No human being should be denied the chance to live free of poverty and oppression and to enjoy a basic standard of education and health. The CDI, all democracies, preach concern for human life and dignity within their own borders; the Index measures whether their policies promote these same concerns in the rest of the world.

In an increasingly integrated world, rich countries cannot insulate themselves from global poverty and insecurity.

Aid

Foreign aid is the first policy that comes to mind when people in rich countries think of helping poorer countries. Aid donors give grants, loans, food, and advice to poor countries to support everything from road building to immunization programs in tiny villages.

Most comparisons between donors are based on how much aid each gives, either in absolute terms or as a percentage of GDP. For the CDI, quantity is merely a starting point in a review that also assesses aid quality. The Index penalizes “tied” aid, which recipients are required to spend on products from the donor nation; this prevents them from shopping around and raises project costs by 15–30 percent. The Index also subtracts debt payments the rich countries receive from developing countries on aid loans. And it looks at where aid goes, favoring poor, uncrupt nations. Aid to Iraq, for instance, is counted at 10¢ on the dollar, since in Iraq corruption is rampant and rule of law weak. Aid to Mozambique, on the other hand, with its high poverty and relatively good governance, is counted at 77¢ on the dollar. Finally, donors are penalized for overloading recipient governments with too many small aid projects. When projects are many and recipient officials few, the obligation to host visits from donor officials and file regular reports becomes a serious burden.

The Index rewards governments for letting taxpayers write off charitable contributions, since some of those contributions go to Oxfam, CARE, and other nonprofits working in developing countries. All CDI countries except Austria, Finland, and Sweden offer such incentives. Since the Index is about government policy, it counts only private giving that is attributed to tax incentives. Private giving to developing countries is higher in the United States than in most countries, at 10¢ per person per day. But even adding that to the 25¢ a day in government aid leaves the United States well short of donors such as Sweden and Denmark, which give $1.00 and $1.07 a day in government aid alone.

The differences between countries in raw aid quantity are dramatic, and as a result they heavily influence the overall aid scores. The Netherlands and the Scandinavian countries take the top four slots on aid, while Japan and the United States end up near the bottom. But quality matters too. Norway edges out Denmark for first place on sheer aid quantity as a share of GDP, but falls to fourth in the CDI for funding smaller projects and being less selective. And the United States would score higher if it did not tie some 70 percent of its aid and gave less to corrupt or undemocratic governments in Iraq, Jordan, Pakistan, and elsewhere.

Trade

The system of rules that governs world trade has developed since World War II through a series of major international negotiating “rounds.” Because rich countries have been able to call the shots, their barriers to some of the goods poor countries are best at producing—including crops—have largely stayed in place. Yet when rich countries tax food imports and subsidize their own farmers’ production, they cause overproduction and dumping on world markets, which lowers prices and hurts poor-country farmers. Industrial tariffs also tend to be anti-poor, with low rates for raw commodities and high rates for labor-intensive, processed goods. U.S. tar-
iff on imports from India, Indonesia, Sri Lanka, and Thailand brought in $2.06 billion in 2005—twice what the United States committed to these countries for tsunami relief the same year. CGD senior fellow William Cline calculates that if rich countries dropped all remaining trade barriers, it would lift 200 million people out of poverty.

For the Index’s trade component, each country’s complex collection of tariffs and subsidies is converted into a flat, across-the-board tariff representing its total effect on developing countries. Canada does best on trade in the 2007 Index, with Australia, New Zealand, and the United States not far behind. EU nations share common trade and agriculture policies, so they score essentially the same on trade. Two European nations outside the EU, Norway and Switzerland, score the worst. For the first time, Japan scores above these two rather than below. Its tariffs on rice now average about 500 percent, which is huge, but well down from the 900 percent of a few years earlier. In fact, the tariffs have not fallen; rather the world price of rice, to which they are compared, has risen.

### Investment

Foreign investment can be a significant driver of development in poor countries. Many of East Asia’s fastest-growing countries—South Korea, Malaysia, Singapore, and
Thailand—benefited from investment from abroad. However, foreign investment can also breed instability (witness the 1997 Asian financial crisis) as well as corruption and exploitation, a prime example being the pollution and unrest in Nigeria's oil-producing regions.

The Index looks at what rich countries are doing to promote investment that is actually good for development. It looks at two kinds of capital flows: 1) foreign direct investment, which occurs when a company from one country buys a stake in an existing company or builds a factory in another country; and 2) portfolio investment, which occurs when foreigners buy securities that are traded on open exchanges. The component is built on a checklist of policies that matter. Do the rich-country governments offer political risk insurance, encouraging companies to invest in poor countries whose political climate would otherwise be deemed too insecure? If so, do they filter out projects likely to do egregious environmental harm or exploit workers? Do they have tax provisions or treaties to prevent overseas investors from being taxed both at home and in the investment country?

The lowest scorers are Ireland and New Zealand, which do not provide political risk insurance and do little to prevent double taxation, and Austria, which restricts pension fund investments in developing countries. Top-ranked Britain does better on all these counts and has participated aggressively in international arrangements to control corruption, such as the Kimberley Process to track and eliminate trade in "blood diamonds" used to finance warlords in countries such as Angola and Sierra Leone.

Migration

Some 200 million people today—one in 33—do not live in the country where they were born. That number should grow as aging rich societies run short of workers, which should be a boon for development. Workers who have migrated from poor to rich countries already send billions of dollars back to their families each year, a flow that surpasses foreign aid. Some immigrants from developing countries, especially students, pick up skills and bring them home—engineers and physicians as well as entrepreneurs who, for example, start computer businesses.

But what about brain drain? Migration has been blamed for emptying African clinics of nurses, who can earn far more in London hospitals. But CGD research fellow Michael Clemens has found little evidence that these skilled people hurt their home country by leaving it. Far more ails African clinics and hospitals than a lack of personnel, and personnel shortages themselves result from many forces—such as low pay and poor working conditions—untouched by international migration policies.

About 175 million people today—one in 40—live in a country different than the one where they were born.

The CDI rewards migration of both skilled and unskilled people, though unskilled more so. One indicator used is the gross inflow of migrants from developing countries in a recent year, including unskilled and skilled workers but leaving out illegals. Another is the net increase in the number of unskilled migrant residents from developing countries during the 1990s. (Based on census data, it cannot be updated often.) The Index also uses indicators of openness to students from poor countries and aid for refugees and asylum seekers.

Austria takes first for accepting the most migrants for its size, with Switzerland not far behind. At the bottom is Japan, whose population of unskilled workers from developing countries actually shrank during the 1990s. The United States, the great nation of immigrants, scores a surprisingly mediocre 4.7. Why? For its size, its inflow of legal immigrants and refugees is actually low compared to many European nations.

Environment

A healthy environment is sometimes dismissed as a luxury for the rich. But people cannot live without a healthy environment. And poor nations have weaker infrastructures and fewer social services than rich countries, making the results of climate change all the more damaging. A study co-authored by CGD senior fellow David Wheeler predicts that a two-meter sea level rise would flood 90 million people out of their homes, many of them in the river deltas of Bangladesh, Egypt, and Vietnam.

The environment component looks at what rich countries are doing to reduce their disproportionate exploitation of the global commons. Are they reinventing greenhouse gas emissions? How complicit are they in environmental destruction in developing countries, for example by importing commodities such as tropical timber? Do they subsidize fishing fleets that deplete fisheries off the coasts of such countries as Senegal and India?

Climate change will be more damaging to poor nations than richer ones because poor nations have weaker infrastructure and fewer social services.
Norway tops this year’s environment standings. Its net greenhouse gas emissions fell during 1995–2005, the last ten years for which data are available, thanks to steady expansion in its forests, which absorb carbon dioxide. Also high is Ireland, whose economy grew 6.6 percent per year faster in the same period than its greenhouse gas emissions; and the U.K., which has steadily increased gasoline taxes and supported wind and other renewable energy sources.

Spain finishes low as a heavy subsidizer of its fishing industry while Japan is hurt by its high tropical timber imports. The United States has not ratified the Kyoto Protocol, the most serious international effort yet to deal with climate change. That gap, along with high greenhouse emissions and low gas taxes, puts the United States last. Two notches up, Australia cuts a similar profile, with the highest per-capita greenhouse gas emissions in the group.

The data and formulas in the CDI have steadily improved since the first edition in 2003. To judge fairly which countries have improved most since 2003, this table applies the 2007 CDI formulas to past years. The average score climbed modestly from 5.0 in 2003 to 5.3 in 2005, a level it achieved again in 2007. Twice as many countries improved as deteriorated over the full period. Several pieces of good news are behind the rise. Norway, Switzerland, the United Kingdom, and the United States gave more aid. Canada, the European Union, and the United States ended quotas on imports of textiles and clothing. Belgium, Denmark, Spain, and Sweden curtailed prohibitions against pension funds investing in developing countries.

Security

Rich nations engage daily in activities that enhance or degrade the security of developing countries. They make or keep the peace in countries recently torn by conflict, and they occasionally make war. Their navies keep open sea lanes vital to international trade. But rich countries also supply developing-country armed forces with tanks and jets.

The CDI looks at three aspects of the security-development nexus. It tallies the financial and personnel contributions to peacekeeping operations and forcible humanitarian interventions, although it counts only operations approved by an international body such as the U.N. Security Council or NATO (thus the invasion of Iraq does not count). It also rewards countries that base naval fleets where they can secure sea lanes vital to international trade. Only four countries get points for that: France, the Netherlands, Britain, and the United States.

Finally, the Index penalizes some arms exports to undemocratic nations that spend heavily on weapons. Putting weapons in the hands of despots can increase repression at home and the temptation to launch military adventures abroad. When weapons are sold instead of being given to developing nations, this diverts money that might be better spent on teachers or transit systems. Still, because countries need guns as well as butter—arming a police force can strengthen the rule of law—the Index penalizes exports to some countries but not all.

Australia and Norway take the top spots on security—Australia for its U.N.-approved action in 1999 to stop Indonesian oppression of East Timor, and Norway for steady contributions to peacekeeping operations in the former Yugoslavia and the Middle East. The United States scores above average overall, earning points for flexing its military muscle near sea lanes but making only average contributions to approved international interventions, while losing points for its record as a leading arms merchant to Middle Eastern dictatorships such as Saudi Arabia. Japan earns a perfect score on arms exports to developing countries (it has none) but lags otherwise because of its peace constitution and minimal international military profile.

Technology

One important way that rich countries affect poorer ones over the long run is through technology. For example, with medical technology from rich countries, human health and survival in Latin America and East Asia made gains over four decades during the 20th century that took Europe almost 150 years. Today, the Internet is facilitating distance learning, democracy movements, and new opportunities to participate in the global economy. Of course, some new technologies do as much harm as good, creating huge new challenges for the developing world: consider the motor vehicle, which symbolizes gridlock and pollution at least as much as it does freedom and affluence in dense and growing cities such as Bangkok.

The Index rewards policies that support the creation and dissemination of innovations of value to developing countries. It rewards government subsidies for research and development (R&D), whether delivered through spending or tax breaks. Spending on military R&D is discounted by half. On the one hand, much military R&D does more to improve the productive capacity of rich countries than the productive capacity of poor ones. On the other, military security is important for development, and military R&D can have civilian spin-offs. Consider that the Pentagon partly funded the early development of the Internet.

Also factored in are policies on intellectual property rights (IPRs) that can inhibit the international flow of innovations. These take the form of patent laws that arguably go too far in advancing the interests of those who produce innovations at the expense of those who use them. Some countries, for example, allow patenting of plant and animal varieties. In such countries, a company could develop a crop variety, say, that thrives in poor tropical soils, patent it, and then opt not to sell it because the poor who could use it have inadequate buying power. Other countries use their leverage to negotiate trade agreements with individual developing countries that extend certain IPRs beyond international norms in the General Agreement on Tariffs and Trade. U.S. negotiators, for example, have pushed for developing countries to agree never to force the immediate licensing of a patent even when it would serve a compelling public interest, as a HIV/AIDS drug might if produced by low-cost local manufacturers.

No country does spectacularly better than its peers on technology. The United States loses points for pushing for compulsory licensing bans, and the Europeans are penalized for allowing the copyrighting of databases containing data assembled with public funds. Greece and Ireland lag considerably behind overall because of low government R&D subsidies. France, which spends a substantial 1 percent of
GDP on government R&D, takes first. Canada, whose policies on IPRs are the least restrictive of the group, places second.

The Bottom Line

The Netherlands comes in first on the 2007 CDI on the strength of ample aid-giving, falling greenhouse gas emissions, and support for investment in developing countries. Close behind are three more big aid donors, Denmark, Sweden, and Norway. Australia, Canada, and New Zealand are among those tied for fifth. They have a very different profile: generally low on aid but strong on trade, investment, migration, and security. Among the G–7—the countries that matter most for developing countries by dint of their economic power— the U.K. comes in second behind Canada, followed by Germany, while Japan comes in last on the Index. Like the United States, Japan’s aid program is small for the size of its economy, and its impact all the smaller when the $5.9 billion that developing countries pay it in debt service each year is taken into account. Japan also tends to engage less with the developing world in ways measured by the Index, with tight borders to the entry of goods and people from poorer countries and limited involvement in peacekeeping abroad.

But even the number-one Dutch score only about average (near 5.0) in four of seven policy areas. All countries could do much more to spread prosperity.

For More Information

For the details of the 2007 Commitment to Development Index, see “The Commitment to Development Index: 2007 Edition,” by David Roodman, available at www.cgdev.org/cdi. The Web site has reports on each of the 21 countries in the CDI, as well as graphs, maps, and spreadsheets. The Web site also has background papers for each policy area: David Roodman on foreign aid, William R. Cline and Roodman on trade, Theodore H. Moran on investment, Elizabeth Grieco and Kimberly A. Hamilton on migration, B. Lindsay Lowell also on migration, Amy Cassara and Daniel Prager on environment, Michael E. O’Hanlon and Adriana Lins de Albuquerque on security, and Keith Maskus on technology.

The Migration Policy Institution and the World Resource Institute, two organizations that significantly contribute to the Index, are excellent sources of additional information. The World Bank’s annual, Global Monitoring Report, is the institution’s look at what rich countries can do to support development.
The Center for Global Development is an independent, non-partisan, non-profit think tank dedicated to reducing global poverty and inequality through policy oriented research and active engagement on development issues with the policy community and the public. A principal focus of the Center’s work is the policies of the United States and other industrialized countries that affect development prospects in poor countries. The Center’s research assesses the impact on poor people of globalization and of the policies of governments and multilateral institutions. In collaboration with civil society groups, the Center seeks to identify policy alternatives that will promote equitable growth and participatory development in low-income and transitional economies. The Center works with other institutions to improve public understanding in industrialized countries of the economic, political, and strategic benefits of promoting improved living standards and governance in developing countries.
