

Modernizing Development Finance to Promote Prosperity and Serve US Foreign Policy
Testimony before the Senate Foreign Relations Committee

Dr. Todd J. Moss
Chief Operating Officer and Senior Fellow
Center for Global Development
July 7, 2016

Thank you Chairman Corker, Ranking Member Cardin, and other members of the Committee. I appreciate being invited to testify again and the opportunity to highlight ways the United States can more effectively support private sector growth and economic opportunity around the world. I proudly served in the State Department under Secretary Condoleezza Rice and continue to work closely on global economic policy issues at the nonpartisan Center for Global Development. I have three points today, drawing on my work at CGD with my colleague Ben Leo.

First, development finance, rather than aid, is the future. Aid is the right tool for tackling health challenges and humanitarian crises. Aid has been much less effective at generating broad economic growth. However, when carefully targeted, aid can be useful in addressing specific barriers to business. The Millennium Challenge Corporation model, which uses five-year compacts to explicitly attack constraints to growth, is a great example. So too are the US Treasury's technical assistance programs and USAID's laudable coordination of the Power Africa initiative.

Yet it is development finance—or the deployment of commercial capital for public policy purposes—that is the most potent weapon we have for expanding markets and spurring private sector growth. When the United States wants to encourage job creation in Tunisia, wants to catalyze infrastructure investment in Nigeria, wants to bring Pakistani women into the banking sector, we turn to development finance.

Development finance is the future because of the changing global landscape. Many previously poor countries are richer today and are looking for more than aid. They want to partner with the United States to deliver jobs, roads, and electricity.

Development finance is the future because of the rise of China, India, and other emerging markets. These countries, along with our traditional allies in Europe, are using development finance to bolster their influence and to expand investment opportunities. The United States has made a start, but risks falling further behind.

Most of all, development finance is the future because of who we are as a country. Americans believe in our model of private sector-led capitalism. Our deep capital markets, our culture of

entrepreneurship, and our belief in free markets all provide a unique platform for using development finance to promote prosperity.

Fortunately, the United States already has a very good development finance institution, the Overseas Private Investment Corporation. Since 1971, OPIC has provided political risk insurance and debt capital to private sector projects around the world in support of US foreign policy and development objectives. For 38 years in a row, OPIC has returned money into the US Treasury. Our recent analysis at CGD has shown that OPIC has been investing principally in the very sectors that are the leading constraints to economic growth: infrastructure and access to finance.¹

While some have worried that OPIC could be a boon for large US corporations or engender corporate welfare, our recent analysis of OPIC's portfolio has shown this to be patently untrue. Instead, we find that less than 8 percent of OPIC commitments over the last five years have involved Fortune 500 companies.²

My second point is that **while OPIC is small and high-performing, it could be even better with a few tweaks that Congress could enact at no additional cost to taxpayers.**³ Chief among these reforms is allowing OPIC limited authority to make equity investments rather than be restricted to only issuing debt. Many projects in the riskiest markets where the US Government needs OPIC the most are at a stage where they need equity, not debt. In fact, nearly every other development finance institution in the world has equity authority, which accounts for nearly all of their project commitments in the poorest countries. OPIC is an exception because of a holdover from the Nixon administration.

Another simple reform that would bring large benefits at no cost is multi-year authorization. Large infrastructure projects take years to negotiate and implement, yet OPIC has been forced to rely on annual authorizations since 2007. OPIC should be authorized for an initial five-year period, with the goal of moving to permanent authorization.

A final minor reform would be to allow OPIC to retain a slightly larger portion of its profits to add staff to clear the backlog of potential projects. OPIC does not need more capital. It needs to hire a few dozen more people to deploy that capital. The agency covers more than 150 countries yet currently has only about 200 staff, or less than what we deploy to a mid-sized embassy.

My final point: if the United States is serious about promoting market solutions to poverty and insecurity, **we need a modern, full-service US Development Finance Corporation worthy of the world's largest economic power.** In the annex to my testimony, Ben Leo and I provide a series of options for how Congress and the next President could structure such an institution consistent with bipartisan support and budgetary realities.⁴ A US Development Finance Corporation could bring OPIC into the 21st Century by consolidating existing tools and instruments—currently spread across multiple federal agencies—and enable their strategic deployment to promote private sector growth. If we fail to update our development finance tools, the United States stands to lose

out to other countries on potential opportunities in the next wave of emerging markets. We would also be neglecting one of our most powerful levers to support prosperity and stability abroad. Modernizing America's development finance would cost nothing, it would bolster our common fight against the remaining pockets of global poverty, and it would support our most pressing national security goals.

Bringing US Development Finance into the 21st Century

Ben Leo and Todd Moss

Introduction

The future of development policy is in development finance. Developing countries need aid less and less as their incomes rise and economies grow. What they need now is private investment and finance. US development policy, however, has failed to bring its development finance tools in line with this reality. Related US efforts have not been deployed in an efficient or strategic manner because authorities are outdated, staff resources are insufficient, and tools are dispersed across multiple agencies.

Other players are doing more. Well-established European development finance institutions (DFIs) are providing integrated services for businesses, and these services cover debt and equity financing, risk mitigation, and technical assistance. Moreover, emerging-market actors—including China, India, Brazil, and Malaysia—have dramatically increased financing activities in developing regions such as Latin America and Sub-Saharan Africa.

As the needs of developing countries have changed, so has the political and economic environment in the United States. First, traditional development dynamics are shifting rapidly from a donor-recipient aid relationship to win-win partnerships involving public and private actors. Second, most US aid agencies typically are not positioned to address many pressing development priorities, such as expanding economic opportunities in frontier markets. Third, the US development assistance budget has become increasingly constrained, with growing pressure to cut programs.

Within this context, we assess the need for a modern, full-service US Development Finance Corporation (USDFC) and provide a series of options for how the next US president could structure such an institution consistent with bipartisan congressional support and budgetary realities.

POLICY RECOMMENDATIONS

- Establish a full-service, self-sustaining US Development Finance Corporation (USDFC) that delivers development results, advances US foreign and commercial policy objectives, and reduces the federal deficit through modest operating profits.
- Implement reforms to ensure that the USDFC (1) crowds in private capital and demonstrates clear “additionality,” (2) publicly reports on its development impact, and (3) has flexible portfolio and staffing levels to adapt to shifting US investor needs.

For such a USDFC, we propose below potential products, services, and tools; size, scale, and staffing requirements; governance structures and oversight functions; performance metrics; and capital structure models. We conclude with a notional implementation road map that includes the required US executive and legislative actions.

Responding to the New Development Finance Landscape

The strategic imperative for US development finance has increased tremendously. First, citizens in Latin America, Africa, and other regions are most concerned about employment and economic opportunities. According to representative surveys, more than two-thirds of African citizens cite employment, infrastructure (e.g.,

electricity, roads, water and sanitation), inequality, and economic and financial policies as the most pressing problems facing their nations (see figure 1).¹ In Latin America, roughly 60 percent of survey respondents cite employment, economic, and financial policy issues, as well as crime and security concerns. In contrast, only 20 percent of Africans and Latin Americans are most worried about health, education, food security, or environmental issues—the issues that existing US development policy targets the most.

Second, businesses in emerging and frontier markets are most constrained by inadequate access to capital, unreliable electricity, burdensome tax policies, and unstable political systems. Access to finance and reliable electricity are the most frequently cited issues in almost half of the 81 surveyed developing countries, and these issues negatively impact firms in all developing regions.² To illustrate, roughly two-thirds of surveyed Nigerian and Pakistani firms cite unreliable electricity as their biggest constraint, and nearly half of all firms surveyed in Côte d'Ivoire, Indonesia, and Zimbabwe cite access to finance as their biggest challenge.

Third, the relative and absolute importance of foreign aid has declined significantly over the past two decades. In 1990, aid exceeded 20 percent of gross national income in 13 developing countries (out of 120 examined countries).³ That figure had fallen to only four developing countries in 2012 (Afghanistan, Burundi, Liberia, and Malawi), despite a doubling of total global aid during

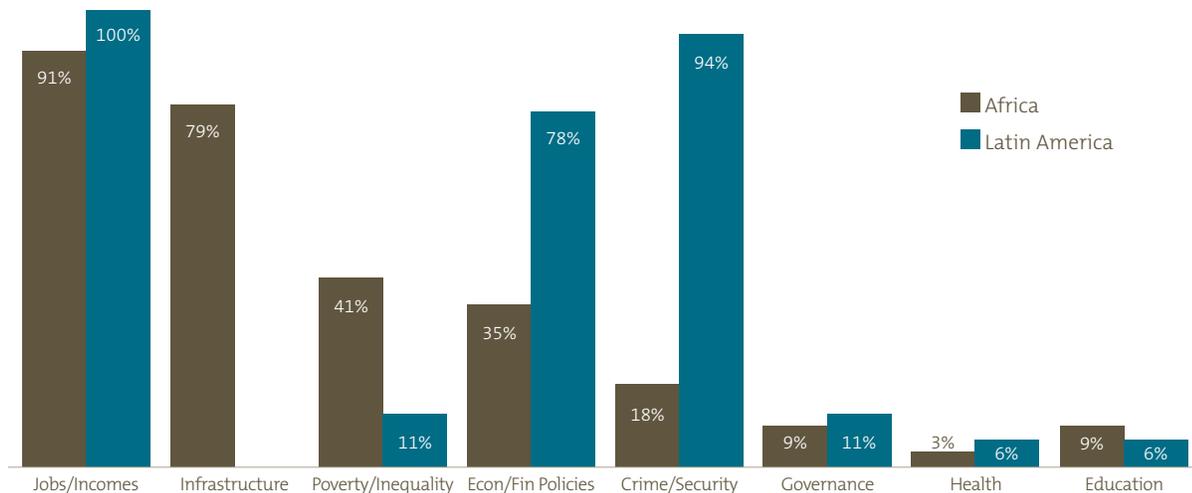

the same period from \$59 billion to \$133 billion. The exponential increase in government revenues, driven by both economic growth and improved tax administration, has been even more striking (see figure 2).⁴

Fourth, foreign government partners are increasingly focused on attracting private investment, especially in infrastructure and productive sectors. Nearly every national development strategy emphasizes attracting private investment for physical infrastructure (e.g., electricity and transport) and labor-intensive sectors (e.g., agriculture, services, and manufacturing), reflecting the political imperative of establishing more inclusive economic opportunities in the near and medium term for the rapidly expanding working-age populations in many regions.

At the same time, the development finance landscape has changed dramatically with the entry of several emerging-market actors. The China Development Bank and the Export-Import Bank of China were established in 1994. Both now have major financing portfolios throughout the world, particularly in Latin America and Sub-Saharan Africa. China is far from the only emerging-market actor in developing countries. India, Malaysia, Turkey, Brazil, and other countries now have public entities that provide project and trade finance, as well as guarantees.

Finally, many well-established organizations in traditional donor capitals now provide integrated services for businesses that cover financing, risk mitigation, and technical assistance. These organizations include FMO

Figure 1 African and Latin American Development Priorities Are in Areas US Development Policy Targets the Least

(Netherlands), DEG (Germany), PROPARCO (France), and the International Finance Corporation (IFC, the private-sector arm of the World Bank Group). This model has streamlined available private sector–based development tools under one institutional structure, thereby enhancing efficiency and effectiveness.

Adjusting to US Political and Budgetary Realities

The political and economic environment within the United States has also changed dramatically, particularly over the past five years. First, development dynamics are shifting rapidly from a traditional donor-recipient aid relationship to mutually beneficial partnerships involving public and private actors. An illustration of this trend is the Obama administration's Power Africa initiative, which uses a three-pronged approach involving (1) country government reforms; (2) private-sector investments; and (3) US government cofinancing, risk mitigation, and technical assistance.

Second, most US aid agencies typically are not positioned to address many pressing development priorities, such as expanding economic opportunities in frontier markets. In such places, the focus should be on promoting greater engagement by private investors and businesses, as noted earlier. This focus involves using non-aid agencies like the Overseas Private Investment Corporation (OPIC), the Export-Import Bank of the United States, and the private-sector windows of the multilateral development

banks. The Millennium Challenge Corporation (MCC) is the noteworthy exception to this aid agency dynamic. However, MCC is not scalable because of its grant-based model and its need for congressional appropriations, as well as its ability to work in a limited number of countries.

Third, the US development assistance budget has become increasingly constrained, with growing pressure to cut programs. At the same time, domestic political constituencies have remained strong for many social-sector issues, such as combating infectious diseases (e.g., HIV/AIDS, malaria) and promoting access to education. This suggests that any future budgetary cuts will likely be focused on program areas that lack such vocal constituencies, such as economic development programs outside of frontline states. Collectively, this also means that the next US president will be highly constrained in promoting private sector–based development models through traditional development assistance budgets.

Existing US Private Sector–Based Development Programs

The US government's primary development finance vehicle is OPIC, an independent government agency that mobilizes private capital in emerging and frontier economies to address development challenges and to advance US foreign policy objectives. OPIC provides US investors with debt financing, loan guarantees, political risk insurance, and support for private-equity investment funds. It operates on a self-sustaining basis and has

provided positive net transfers to the US Treasury for nearly 40 consecutive years. Since its inception, OPIC has helped mobilize more than \$200 billion of US investment through more than 4,000 development-related projects.

With few exceptions, OPIC has not evolved since it was first established in 1971. The most significant exception relates to debt seed capital for private-equity funds, which OPIC began providing in 1987. OPIC remains highly constrained by inadequate staff and outdated authorities. For instance, it must rely on congressional appropriations to cover annual administrative expenses (e.g., salaries, travel, and office space) despite generating significant profits on a consistent basis. This de facto constraint, driven by congressional unwillingness to expand the number of staff, has prevented OPIC from fully leveraging its existing capital base.

Other programs within US agencies that promote private sector–led development approaches are spread across multiple agencies, resulting in redundancies, inefficiencies, and, frequently, a lack of coherence.

- **The US Agency for International Development’s Development Credit Authority (DCA):** USAID’s DCA provides partial risk guarantees to unlock private financing in support of US development priorities. In 2013, DCA approved 26 new partial credit guarantees in 19 countries, which may mobilize nearly \$500 million in private capital over time.⁵
- **USAID Enterprise Funds:** Since 1989, Congress has appropriated resources for a range of enterprise funds, which are capitalized either entirely or partially by USAID grants. This program, which has a mixed track record,⁶ originally began with a focus on promoting private enterprise in former Eastern Bloc countries. Similar funds have been launched in other countries since then, such as in Egypt and Tunisia.
- **US Treasury Office of Technical Assistance (OTA):** The US Treasury’s OTA embeds highly experienced advisers into finance ministries and central banks to promote financial-sector strengthening and to improve public financial management.
- **US Trade and Development Agency (USTDA):** This small, autonomous agency is primarily focused on connecting US businesses to export opportunities in developing countries. However, it also promotes private sector–based development through small-scale financing for feasibility studies and technical assistance programs.

Lastly, the US government also supports large-scale grant operations through the MCC, USAID, and the US State Department. These programs help address a broad range of private sector–based development issues, such as infrastructure and business climate reforms.

- **Millennium Challenge Corporation:** The MCC provides large-scale grants to well-performing countries with low and lower middle incomes to support poverty reduction through sustainable economic growth. To date, the MCC has approved more than \$8 billion in compact and threshold programs that have focused largely on infrastructure, agriculture, and enterprise development.⁷
- **Other USAID Programming:** USAID has a range of grant-based programs within its Bureau for Economic Growth, Education, and Environment that promote private enterprise in developing countries. These programs focus largely on four key areas: (1) building skills and management capacity, (2) deepening access to finance, (3) supporting business climate reforms, and (4) establishing linkages with US businesses and organizations.⁸

Proposal for a Modern Scaled-Up US Development Finance Corporation

A modern, scaled-up USDFC would promote US policy objectives by harnessing America’s three greatest strengths—innovation and technology, entrepreneurship, and a deep capital base—at no additional cost to US taxpayers. It also would make a serious contribution to US foreign policy goals by aligning strongly with developing countries’ most pressing priorities (e.g., employment and economic opportunities). Lastly, the proposed USDFC would promote America’s commercial policy objectives by facilitating investment and business opportunities in the next wave of emerging markets.

Products, Services, and Tools

Almost all major DFIs have become full-service institutions that promote private sector–based development (see table 1). As with other institutions, the USDFC would offer a full suite of products, services, and tools to promote such development approaches. Currently, OPIC can offer direct loans, loan guarantees, risk insurance, and seed financing for independently managed investment funds. A full suite would add advisory services, feasibility studies, direct investments including equity, and technical assistance for business-climate reforms, which other US agencies such as USAID, the State Department, USTDA, and the US Treasury Department have the authority to support. The USDFC

Table 1 Development Finance Institutions, Product and Service Coverage (2013)

Institution	Equity Authority	Technical Assistance	Grants Window	First-Loss Funding	Equity (Percentage of Revenues)
OPIC (US)	No	No	No	No	0
FMO (Netherlands)	Yes	Yes	Yes	Yes	17
PROPARCO (France)	Yes	Yes	Yes	Yes	9
CDC Group (UK)	Yes	No	No	Yes, for some impact funds	95
DEG (Germany)	Yes	Yes, including via BMZ	Yes, feasibility studies	Yes	28
IFC (World Bank)	Yes	Yes	Yes	Yes	36

Source: DFI annual reports

would consolidate all of these authorities and programs within a single, efficient, market-based institution. This change would require congressional authorization.

The USDFC also should have the authority to support non-US investors in certain circumstances. OPIC currently can only support firms or investors with significant American ownership or operational control. No other major DFI ties their financial engagement to national firms. This flexibility enables other DFIs to promote economic growth and job creation through local businesses in developing countries. This restriction has prevented OPIC from supporting strategic objectives where US investors are not active or prospective participants in a given country’s market or sector. The expanded authority could be limited to low-income countries and local firms domiciled in the respective developing country. Firms from developed or middle-income countries, along with their respective subsidiaries, could remain ineligible for USDFC operations unless there were highly compelling benefits to US development or other foreign policy objectives.

Size, Scale, and Staffing

The USDFC’s size and scale should be determined by the combination of market demand, the ability to demonstrate clear “additionality” (see further details below), and the maintenance of rigorous credit-quality standards and oversight. In addition, it must demonstrate tangible development results throughout its portfolio. As a result, *there should not be an ex ante target size*. Instead, the USDFC should have the ability to access significant sources of capital to respond to market dynamics and US development objectives, with appropriate oversight by the US Congress and the

Office of Management and Budget. Currently, OPIC has legislative authority to support a \$29 billion portfolio of loans, guarantees, and insurance.⁹ As of 2013, \$11 billion of this capacity was undeployed because of insufficient staff and constrained authorities.

Existing bilateral DFIs provide a rough benchmark when considering the USDFC’s potential scale. Their portfolios range from 0.15 percent of gross domestic product (GDP) in the United Kingdom to more than 1 percent in the Netherlands. If these same simplistic ratios were applied to the United States, the USDFC could have a total portfolio ranging between OPIC’s current statutory authority of \$29 billion and \$180 billion.

The USDFC’s staffing size and administrative expenses also should reflect its operational requirements and objectives. Currently, OPIC has nearly 230 employees and an operating budget of \$67 million.¹⁰ The average OPIC employee is responsible for approximately \$8 million in portfolio exposure. If OPIC’s existing portfolio-to-employee ratio remained constant, then the USDFC could require between 370 and 2,200 employees, depending on its portfolio size. This increase would entail an annual operating budget of between \$110 million and \$665 million, which would be *self-financed through the partial retention of USDFC profits* (see figure 3).¹¹ By comparison, the current staffing size of peer DFIs is as follows: 4,000 in the World Bank’s IFC, 499 in Germany’s DEG, 336 in the Netherlands’ FMO, 177 in France’s PROPARCO, and 102 in the United Kingdom’s CDC.

Governance Structure

The USDFC would be an independent government agency led by a management team appointed by the White House and overseen by a board of directors that includes both government and private-sector representatives. In this manner, the board would reflect the Corporation’s development and foreign policy objectives, as well as serve as a model for promoting private sector–based development. The Corporation also should include an equal number of public-sector representatives from each major political party. This would promote greater strategic continuity and help minimize short-term political pressures. Moreover, the board’s composition should seek to ensure coverage of several core competencies, such as international development, risk management, human resources and legal matters, global financial institutions, and specific priority sectors (e.g., power and transportation).

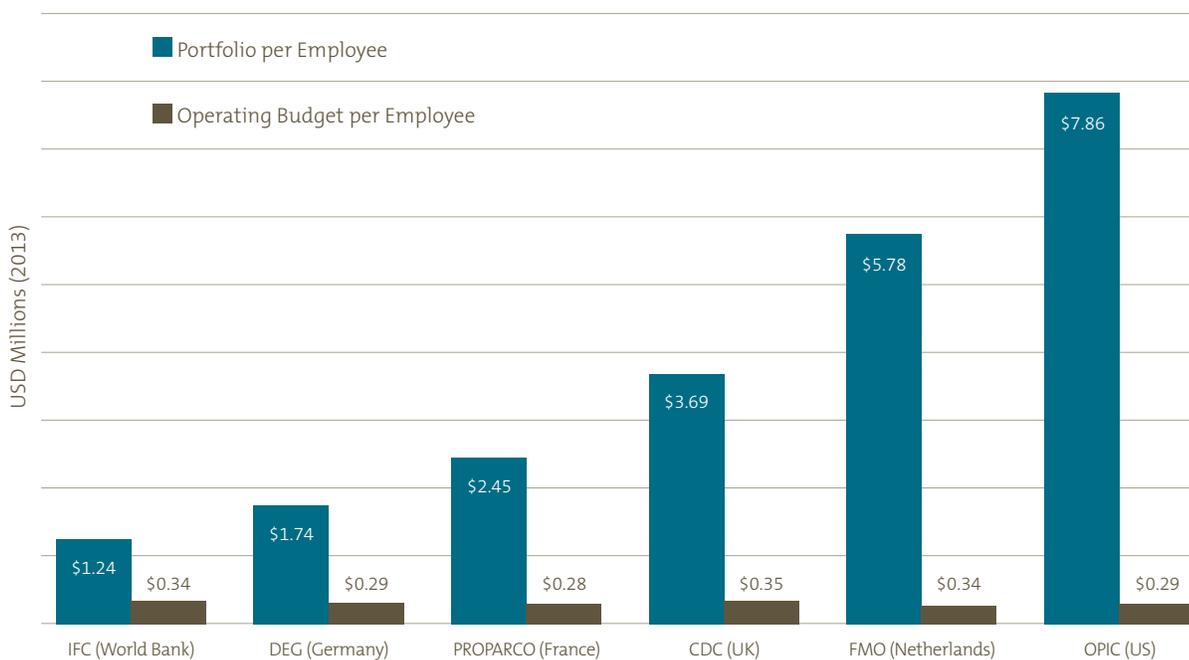

Monitoring, Evaluation, and Reporting

The USDFC should establish a performance measurement system that is modeled on global best practices.¹² OPIC

currently uses a Development Impact Matrix to evaluate and monitor both prospective and approved investment projects; however, the information is not reported publicly. The USDFC’s performance measurement system should expand upon OPIC’s existing approach by measuring, considering, and reporting on the “additionality” of its operations. This would require both ensuring that the institution does not compete with private sources of investment capital and maintaining appropriate financial performance within its portfolio. Lastly, the USDFC would collect and publicly report on a series of institutional efficiency and performance metrics, such as financial performance, operating budget ratios, and average investment transaction review time.¹³

Across its operations, the USDFC should publicly disclose information by default and have a high bar for withholding information in deference to commercial confidentiality concerns. At a minimum, this would include all project description summaries and Development Impact Matrix scores (at the time of project approval). Moreover, the Corporation should publish project-level development performance data on an annual basis.

Figure 3 OPIC Outperforms Other DFIs on Portfolio Size and Operating Budget Per Employee

Source: DFI annual reports and authors’ calculations

Capital Structure

The USDFC's capital structure should reflect its desired scale, comparative advantage, and role within the US government's development and foreign policy toolkit. In particular, its structure should only represent its potential maximum portfolio size. The actual size, as measured by total contingent liabilities, must reflect the institution's ability to support individual transactions with strong development impact, prudently manage financial risks, and consistently demonstrate strong "additionality" vis-à-vis private-sector alternatives.

- Status Quo Structure:** Under this option, the USDFC would rely upon OPIC's existing maximum contingent liability limit of \$29 billion.¹⁴ This limit has not been changed since 1998, when it was increased from \$23 billion. Future adjustments to the USDFC's contingent liability limit would be considered on an ad hoc basis. Advisory services and technical assistance activities would be financed out of retained earnings at no additional cost to taxpayers.
- Revised OPIC Contingent Liability Limit:** Under this option, the USDFC would rely upon an updated version of OPIC's existing contingent liability. This limit would be adjusted upward to roughly \$42 billion, thereby converting the current exposure limit from 1998 dollars to 2014 dollars.¹⁵ Going forward, the maximum contingent liability limit would be inflation adjusted, which would prevent the erosion of the USDFC's potential portfolio size in real terms. It would likely be many years, if ever, before that limit is approached. However, setting this limit would provide the USDFC with adequate flexibility to execute scaled private sector-based development approaches, while simultaneously ensuring proper portfolio risk management and oversight.

Policy Recommendations and Implementation Road Map

The implementation road map for the proposed USDFC will require actions by the US executive and legislative branches. These actions include the following:

- The next US president should put forward a proposal to establish a consolidated US Development Finance Corporation, along with template legislation.**

This should take place within the first 100 days in office. Such action would instill an appropriate level of political commitment and help build momentum within Congress. This proposal would be further fleshed out and amended as appropriate in close partnership with Congress.

- The US Congress should pass legislation that will establish a USDFC to function as the premier development agency focused on private sector-based approaches.**

At a minimum, the legislation should address the following components: products, services, and tools; size, scale, and staffing requirements; governance structures and oversight functions; performance metrics (including stringent "additionality" requirements); and capital structure models.
